

## METHOD OF CONTROLLING A COMMUNICATIONS SESSION

Abstract of the Disclosure

5        Method of controlling a communications session (101) can include a handset (102) determining one of a docked condition (150) and an undocked condition (152). A communications session (101) is initiated where the communications session spans from the handset (102) to a remote communications device (104) using a WPAN communications link (110), and out from the remote communications device (104) using a cellular link (112). The  
10      handset (102) can translate between the WPAN communications link (110) and the cellular link (112). If the handset (102) is in the docked condition (150), the handset (102) can route an audio component (153) through the docking station (106). If the handset (102) is in the undocked condition (152), the handset (102) can route the audio component (155) through the handset (102).
